# Cascading Style Sheets (CSS)

**Styling the Web**

Luigi De Russis

Photo by [Marcus Ganahl](#) on [Unsplash](#)

# Goal

- Styling web content
  - Definitions of the Cascading Style Sheets (CSS)
  - Basic concepts
  - How to use CSS in a web page

# Outline

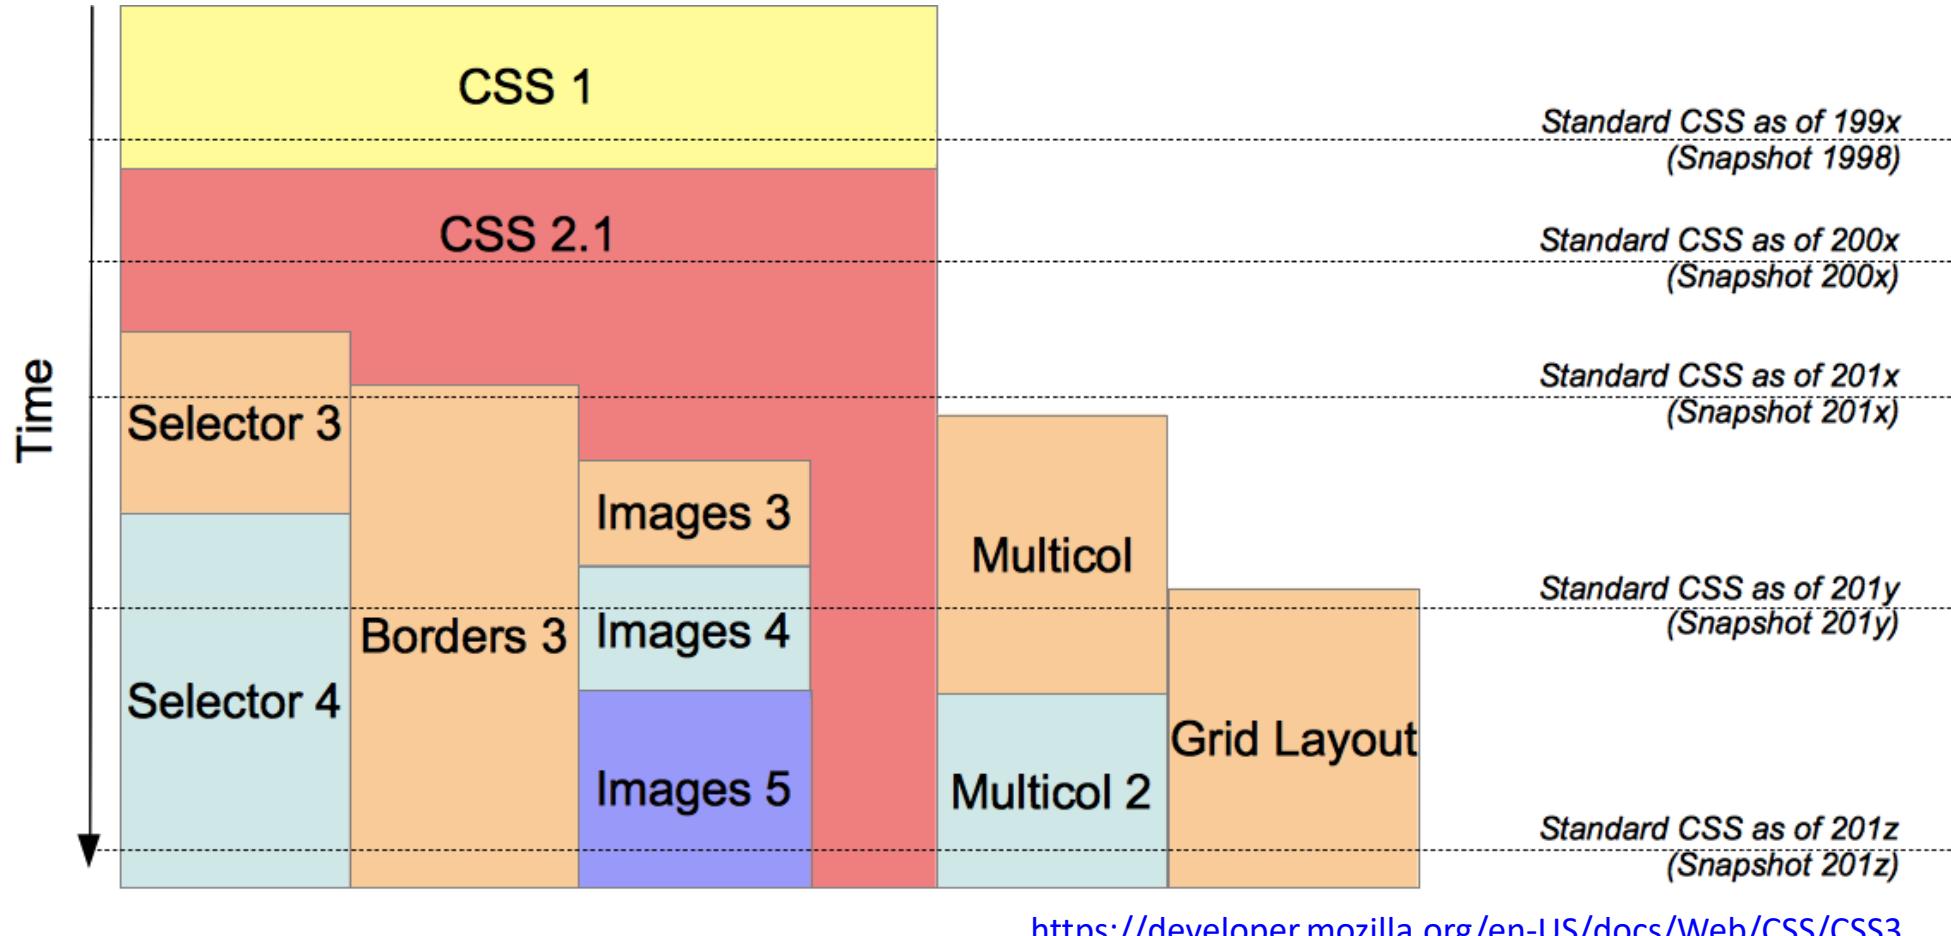

- CSS syntax
- CSS selectors
- CSS cascading
- CSS box model
- CSS positioning schemes

# Cascading Style Sheets

- CSS 1: W3C recommendation (17 Dec 1996)
- CSS 2.1: W3C Recommendation  
(7 June 2011)
- CSS 3: modular approach, different stages (REC, PR, CR, WD) for different parts
  - See <https://www.w3.org/Style/CSS/>
- Resources:
  - <https://developer.mozilla.org/en-US/docs/Web/CSS>
  - <https://developer.mozilla.org/en-US/docs/Web/CSS/Reference>

# Overview of CSS development approach

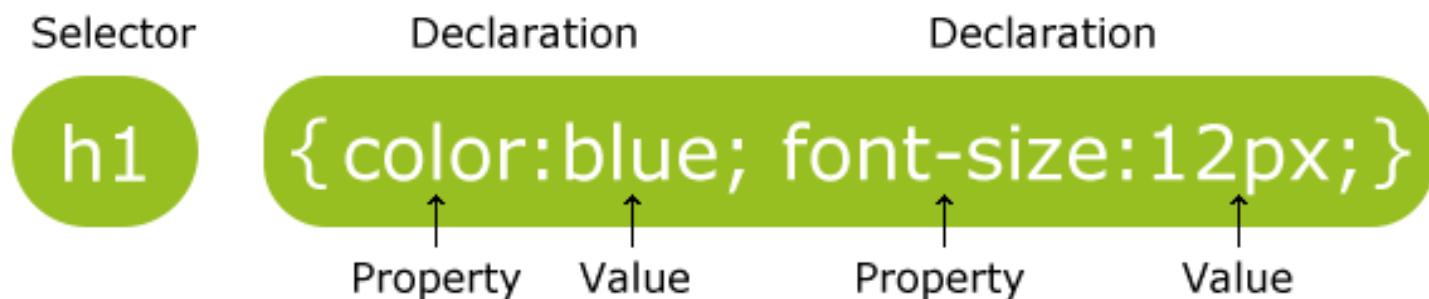

Cascading Style Sheets

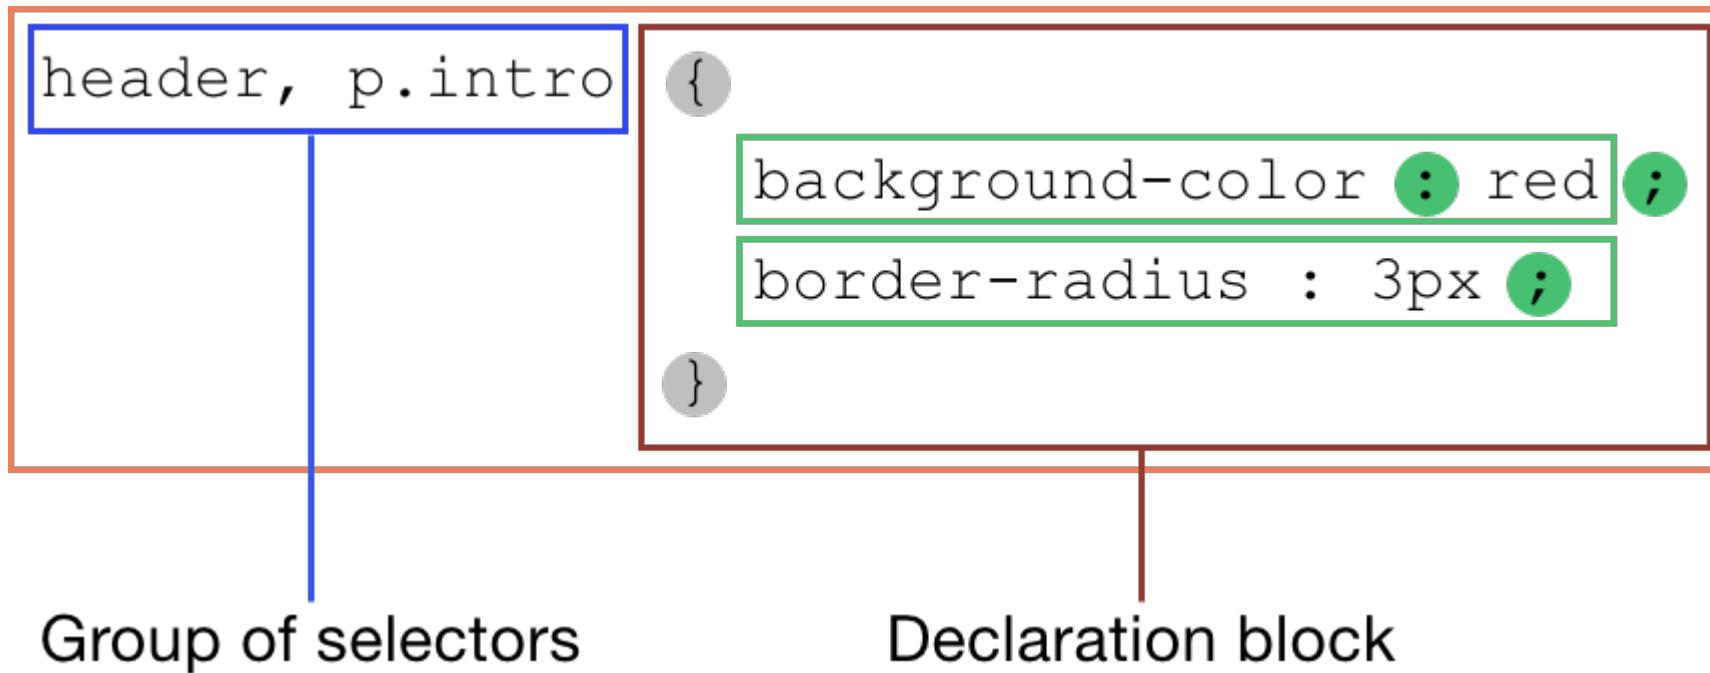

# **CSS SYNTAX**

# CSS Syntax

- CSS is based on **rules**
- A rule is a statement about one [stylistic] aspect of one or more HTML element
  - **Selector + Declaration(s)**
- A style sheet is a set of one or more rules that apply to an HTML document

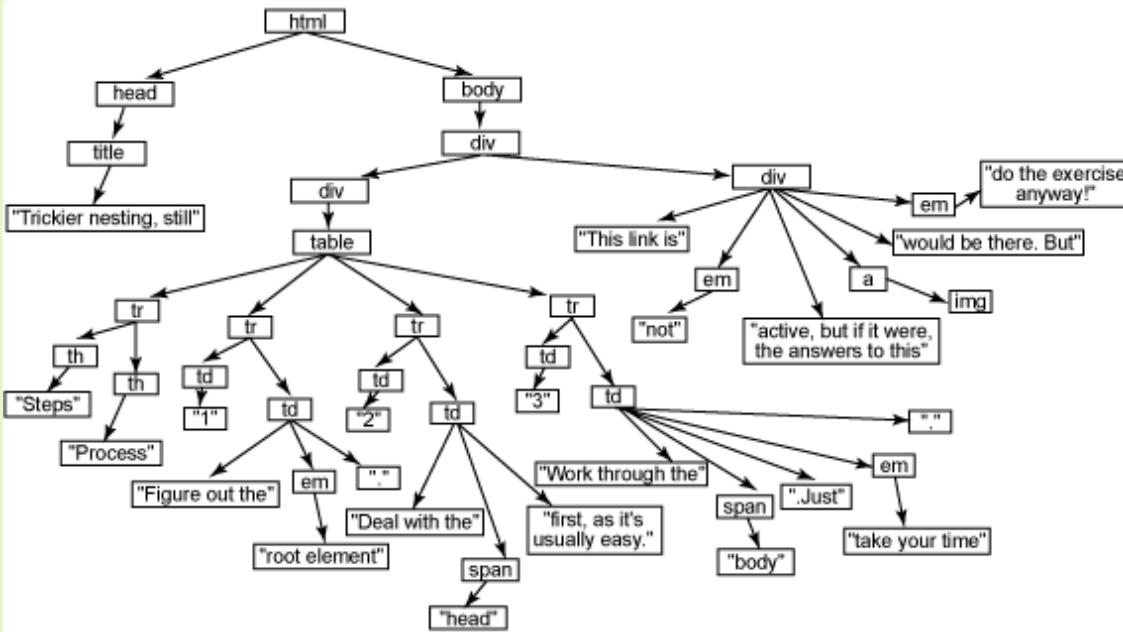

# General syntax

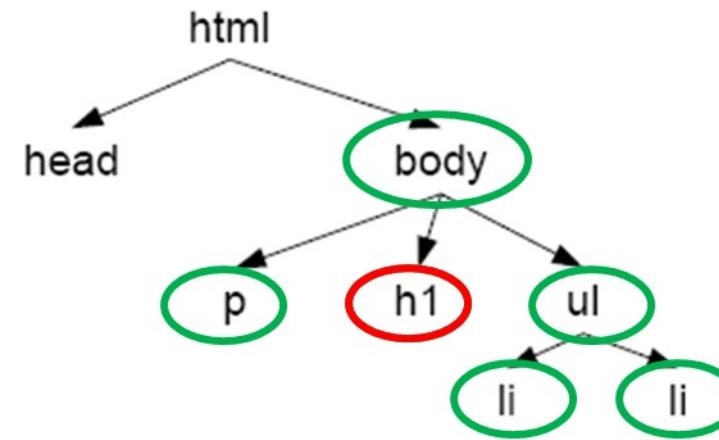

# HTML nested structure

```
<html lang="en">
<head>
    <title>Trickier nesting, still</title>
</head>
<body>
    <div>
        <div>
            <table>
                <tr><th>Steps</th><th>Processes</th></tr>
                <tr><td>1</td><td>Figure out the <em>root element</em>. </td></tr>
                <tr><td>2</td><td>Deal with the <span>head</span> first as it's
usually easy.</td></tr>
                <tr><td>3</td><td>Work through the <span>body</span>. Just <em>take
your time</em>.</td></tr>
            </table>
        </div>
        <div>
            This link is <em>not</em> active, but if it were, the answer to this
<a></a> would be there. But <em>do the exercise
anyway!</em>
        </div>
    </div>
</body>
</html>
```

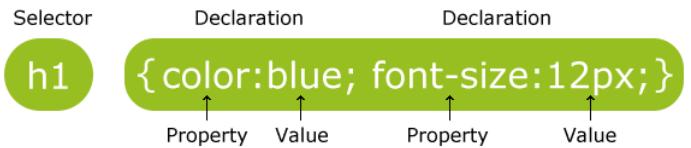

# Tree structure and inheritance

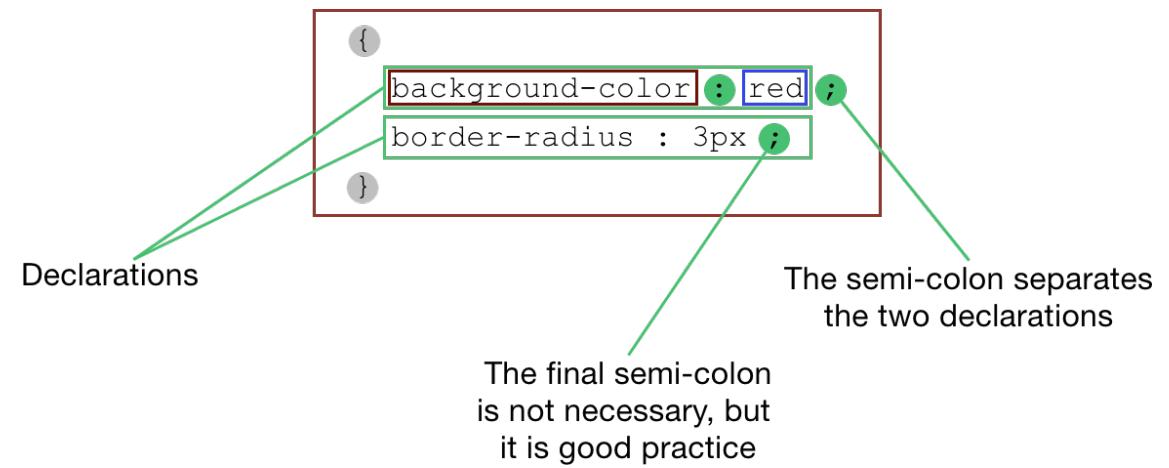

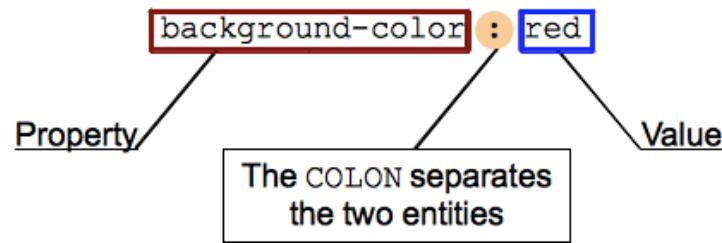

- HTML documents are trees
- Styles are inherited along trees
- When two rules are in conflict the most specific wins
- Example
  - `body {color: green}`
  - `h1 {color: red}`

# Declaration Syntax

A CSS declaration :

# CSS properties (200+)

- Allowed Values (and Default Value):
  - Numbers, measurements, percentage
  - Enumerated options (strings)
  - Colors (name, RGB[A], HSL[A])
- Applies to:
  - Which elements may have this property
- Inherited:
  - Does also apply to children elements?

# CSS Units: Most Used

- CSS has several different **units** for expressing a length
  - format: a number followed by a unit (e.g., 10px)
  - width, font-size, margin, padding, ...
- Two types of length units
  - absolute (fixed)
  - relative
- The most common fixed unit is pixel (px)
  - they are relative to the viewing device
  - for low-dpi devices, 1px is one device pixel (dot) of the display
  - for printers and high-resolution screens, 1px implies multiple device pixels
  - not well suited for responsive design (later on)

# CSS Units: Most Used

- The most common relative units, instead:

Unit	Description
em	Relative to the font-size of the element. 2em means 2 times the size of the font of the current element
rem	Relative to font-size of the root element (<html>) of the HTML page (Root EM)
vw	Relative to 1% of the width of the viewport, i.e., the browser window size
vh	Relative to 1% of the height of the viewport
%	Relative to the parent element

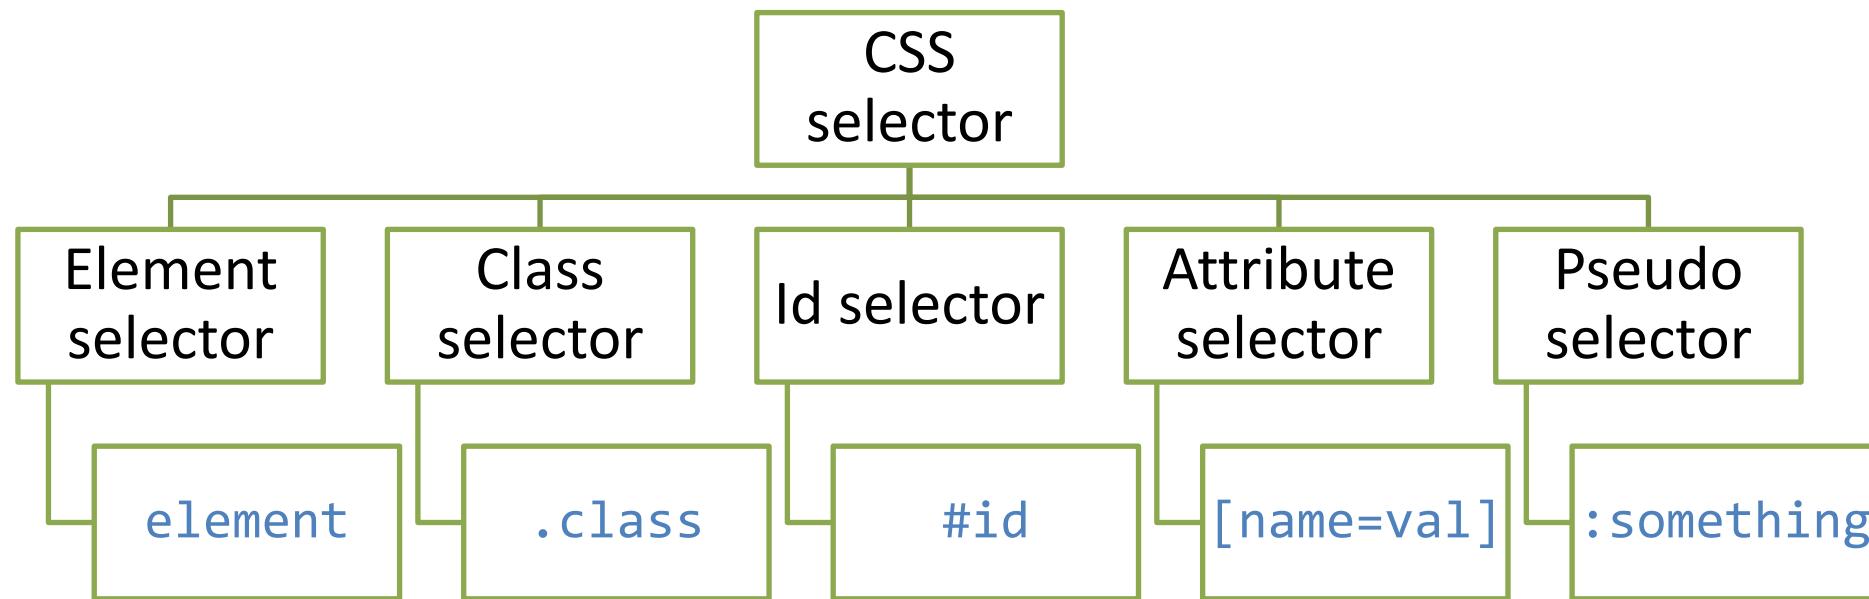

- Suggestions:
  - prefer relative units to absolute ones, when possible
  - rem is (nowadays) preferred to em

Cascading Style Sheets

# **CSS SELECTORS**

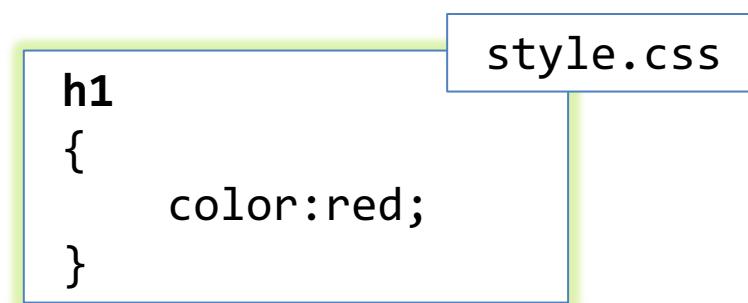

# CSS selectors

- Patterns used to select the element(s) you want to style
- Three main types of selectors plus “pseudo-selectors”

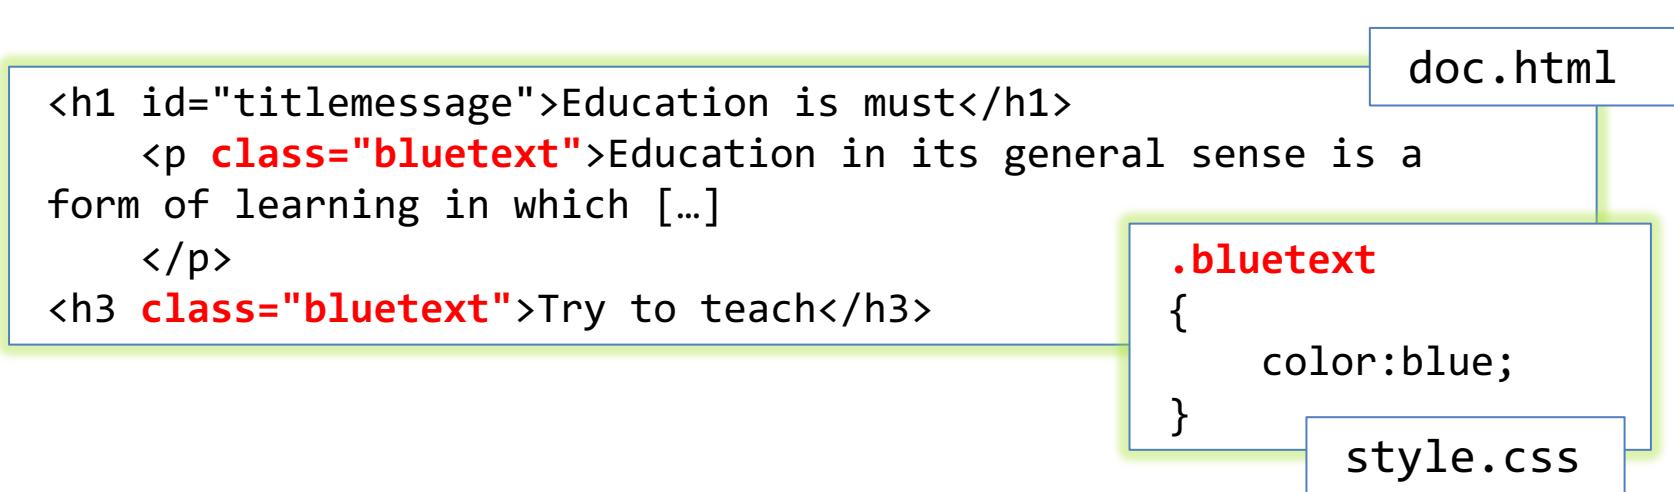

# Element selector

- Used to apply the same style to all instances of a specific element in a document
- Example: apply the color red to all h1 elements that appear in the document

# Class selector

- Used to apply the same style to all elements belonging to a specific (defined) class
- Applies a specific style to a set of related elements, identified by class

# Id selector

- Used to apply a style to a specific element in a document
- You can select a specific element by its (declared) id and apply a style to that (and possibly its children)

The diagram illustrates the relationship between two files: `doc.html` and `style.css`. A green box labeled `doc.html` contains the following code:

```
<h1 id="titlemessage">Education is must</h1>
  <p class="bluetext">Education in its general sense is a
form of learning in which [...]
  </p>
<h3 class="bluetext">Try to teach</h3>
```

A blue box labeled `#titlemessage` contains the CSS rule:

```
#titlemessage
{
  color:gray
}
```

A blue box labeled `style.css` is positioned below the CSS rule. A vertical line connects the `#titlemessage` box to the `id="titlemessage"` attribute in the `doc.html` code.

```
<h1 id="titlemessage">Education is must</h1>
  <p class="bluetext">Education in its general sense is a
form of learning in which [...]
  </p>
<h3 class="bluetext">Try to teach</h3>
```

```
#titlemessage
{
  color:gray
}
```

```
style.css
```

# Attribute selectors

Selector	Example	Example description	CSS
[attribute]	[target]	Selects all elements with a target attribute	2
[attribute=value]	[target=_blank]	Selects all elements with target="_blank"	2
[attribute~=value]	[title~=flower]	Selects all elements with a title attribute containing the word "flower"	2
[attribute =value]	[lang =en]	Selects all elements with a lang attribute value starting with "en"	2
[attribute^=value]	a[href^="https"]	Selects every <a> element whose href attribute value begins with "https"	3
[attribute\$=value]	a[href\$=".pdf"]	Selects every <a> element whose href attribute value ends with ".pdf"	3
[attribute*=value]	a[href*="w3schools"]	Selects every <a> element whose href attribute value contains the substring "w3schools"	3

# Pseudo class selector

- Used to style an element based on something other than the structure of the document
  - E.g., the status of a form element or link

```
/* makes all unvisited links blue */  
a:link {color:blue;}  
/* makes all visited links green */  
a:visited {color:green;}  
/* makes links red when hovered or activated */  
a:hover, a:active {color:red;}  
/* makes table rows red when hovered over */  
tr:hover {background-color: red;}  
/* makes input elements yellow when focus is applied */  
input:focus {background-color:yellow;}
```

# Combining selectors

- `element.class#id[n=v]`  
→ may be combined
- $S_1, S_2$   
→  $S_1 \cup S_2$
- $S_1 S_2$   
→  $S_2$  nested within  $S_1$
- $S_1 > S_2$   
→  $S_2$  if a child of  $S_1$
- $S_1 + S_2$   
→  $S_2$  if it comes after a  $S_1$ ,  $S_1$  padre diretto
- $S_1 \sim S_2$   
→  $S_2$  if it comes later than  $S_1$

# CSS selectors

Selector	Example	Example description	CSS
.class	.intro	Selects all elements with class="intro"	1
#id	#firstname	Selects the element with id="firstname"	1
*	*	Selects all elements	2
element	p	Selects all <p> elements	1
element,element	div, p	Selects all <div> elements and all <p> elements	1
element element	div p	Selects all <p> elements inside <div> elements	1
element>element	div > p	Selects all <p> elements where the parent is a <div> element	2

element+element      div + p      Selects the first <p> element that is placed immediately after <div> elements

element1~element2      p ~ ul      Selects every <ul> element that is preceded by a <p> element  
non importa che sia il padre diretto

[http://www.w3schools.com/cssref/css\\_selectors.asp](http://www.w3schools.com/cssref/css_selectors.asp)

# Display property

- Allows to control element visualization (block or inline)
- Changing an inline element to a block element, or vice versa, can be useful for making the page look a specific way

```
li {display:inline;}
```

```
span {display:block;}
```

[http://www.w3schools.com/Css/css\\_display\\_visibility.asp](http://www.w3schools.com/Css/css_display_visibility.asp)

# Display and visibility properties

- The property `display` allows to hide an element, too
  - The element will be hidden, and the page will be displayed as if the element is not there
- The property `visibility` also can hide an element, but the element will still take up the same space as before
  - The element will be hidden, but still affects the layout

```
h1.hidden {  
    display: none;  
}
```

```
h1.hidden {  
    visibility: hidden;  
}
```

# CSS pseudo-class selectors

Selector	Example	Example description	CSS
:active	a:active	Selects the active link	1
::after	p::after	Insert something after the content of each <p> element	2
::before	p::before	Insert something before the content of each <p> element	2
:checked	input:checked	Selects every checked <input> element	3
:disabled	input:disabled	Selects every disabled <input> element	3
:empty	p:empty	Selects every <p> element that has no children (including text nodes)	3
:enabled	input:enabled	Selects every enabled <input> element	3
:first-child	p:first-child	Selects every <p> element that is the first child of its parent	2
::first-letter	p::first-letter	Selects the first letter of every <p> element	1
::first-line	p::first-line	Selects the first line of every <p> element	1

Selector	Example	Example description	CSS
:first-of-type	p:first-of-type	Selects every <p> element that is the first <p> element of its parent	3
:focus	input:focus	Selects the input element which has focus	2
:hover	a:hover	Selects links on mouse over	1
:in-range	input:in-range	Selects input elements with a value within a specified range	3
:invalid	input:invalid	Selects all input elements with an invalid value	3
:lang( <i>language</i> )	p:lang(it)	Selects every <p> element with a lang attribute equal to "it" (Italian)	2
:last-child	p:last-child	Selects every <p> element that is the last child of its parent	3
:last-of-type	p:last-of-type	Selects every <p> element that is the last <p> element of its parent	3
:link	a:link	Selects all unvisited links	1

# CSS pseudo-class selectors

Selector	Example	Example description	CSS
:not(selector)	:not(p)	Selects every element that is not a <p> element	3
:nth-child(n)	p:nth-child(2)	Selects every <p> element that is the second child of its parent	3
:nth-last-child(n)	p:nth-last-child(2)	Selects every <p> element that is the second child of its parent, counting from the last child	3
:nth-last-of-type(n)	p:nth-last-of-type(2)	Selects every <p> element that is the second <p> element of its parent, counting from the last child	3
:nth-of-type(n)	p:nth-of-type(2)	Selects every <p> element that is the second <p> element of its parent	3
:only-of-type	p:only-of-type	Selects every <p> element that is the only <p> element of its parent	3
:only-child	p:only-child	Selects every <p> element that is the only child of its parent	3
:optional	input:optional	Selects input elements with no "required" attribute	3
:out-of-range	input:out-of-range	Selects input elements with a value outside a specified range	3

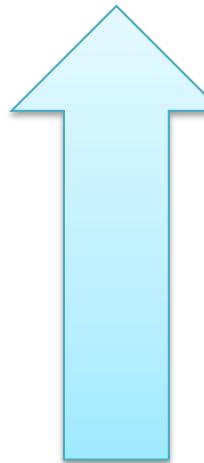

Selector	Example	Example description	CSS
:read-only	input:read-only	Selects input elements with the "readonly" attribute specified	3
:read-write	input:read-write	Selects input elements with the "readonly" attribute NOT specified	3
:required	input:required	Selects input elements with the "required" attribute specified	3
:root	:root	Selects the document's root element	3
::selection	::selection	Selects the portion of an element that is selected by a user	
:target	#news:target	Selects the current active #news element (clicked on a URL containing that anchor name)	3
:valid	input:valid	Selects all input elements with a valid value	3
:visited	a:visited	Selects all visited links	1

Cascading Style Sheets

# **CSS CASCADING**

# Cascading Style Sheets

- The term “cascading” means that a document can include more than one style sheet
- In this case, visualization follows priority rules
  - Inline Style (inside HTML tag)
  - Internal Style (usually in the HTML head section)
  - External Style
  - Browser Default Style

# External style

- Link to an external style sheet using the `<link>` element

```
h1 { font-size:17px;  
      font-family:verdana; color:green; }  
h2 { font-size:18px;  
      font-family:arial; color:red; }
```

style.css

```
<head>  
  <link rel=stylesheet type="text/css"  
        href="style.css">  
</head>  
<body>  
  <h1>Questo testo e' di colore verde, e utilizza il  
      font verdana a 17 pixel</h1>  
  <h2>Questo testo e' di colore rosso, e utilizza il  
      font arial a 18 pixel</h2>  
</body>
```

# Internal style

- <style> element inside the document header
- Not recommended – prefer external styles

```
<head>
  <style type="text/css">
    h1 { font-size:17px; font-family:verdana;
          color:green; }
    h2 { font-size:18px; font-family:arial;
          color:red; }
  </style>
</head>
```

# Inline style

- <style> attribute within an HTML element
- Last resort, just for local (very local) changes

```
<h1 style="font-size:17px;  
font-family:verdana; color:green; "> Questo  
testo e' di colore verde, e utilizza il  
font verdana a 17 pixel </h1>
```

# Priority rules

- Rules can be marked as “important”

```
h1 {  
    color:red !important  
}
```

Browser Styles

User Styles

Author Styles

External & Embedded Styles

if rules have  
*different specificity:*

more general

more specific

if rules have  
*the same specificity:*

declared earlier

declared later

Inline Styles

Author !important Styles

User !important Styles

# CSS specificity

- Specificity determines which CSS rule is applied by the browser
  - Every selector has its place in the specificity hierarchy
1. Type selectors (h1) and pseudo-elements (::before)
  2. Class selectors (.cls), attributes selector ([n=v]) and pseudo-classes (:hover)
  3. ID selectors (#menu)

# The definitive guide to CSS styling order

Includes CSS stylings for SVG

Ordering, selectors or specificity and important keyword does not apply to SVG inline attributes

CSS codes to the right or bottom has higher priority and will be applied.

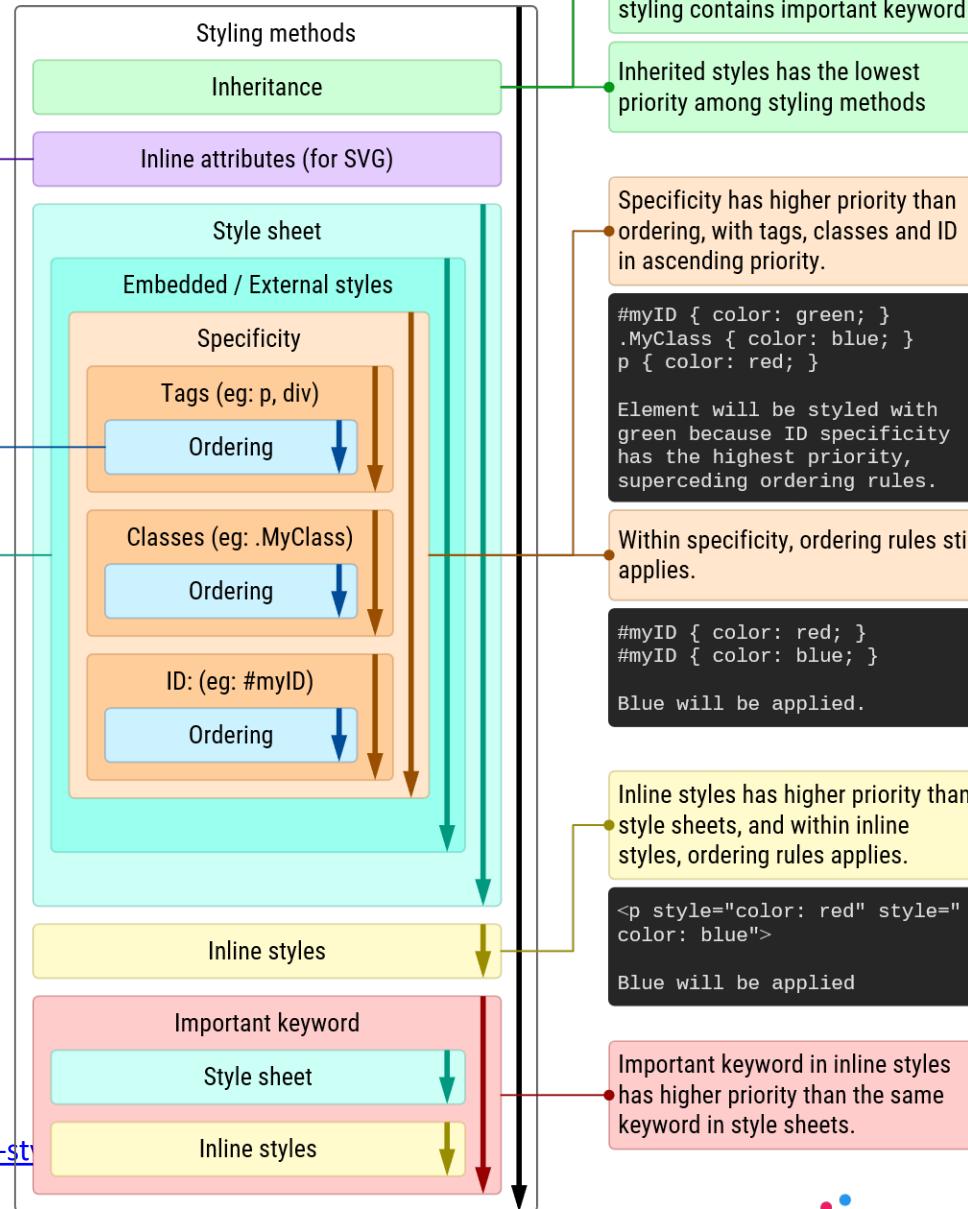

```
p { color: red; color: blue; }  
Blue will be applied
```

```
p {  
  color: red;  
  color: blue;  
}  
Blue will be applied
```

```
p { color: red; }  
p { color: blue; }  
Blue will be applied
```

For each style, ordering rules continue to apply, from left to right and top to bottom.

```
<style>  
#myID { color: red }  
</style>  
<style>  
#myID { color: blue }  
</style>  
Blue will be applied
```

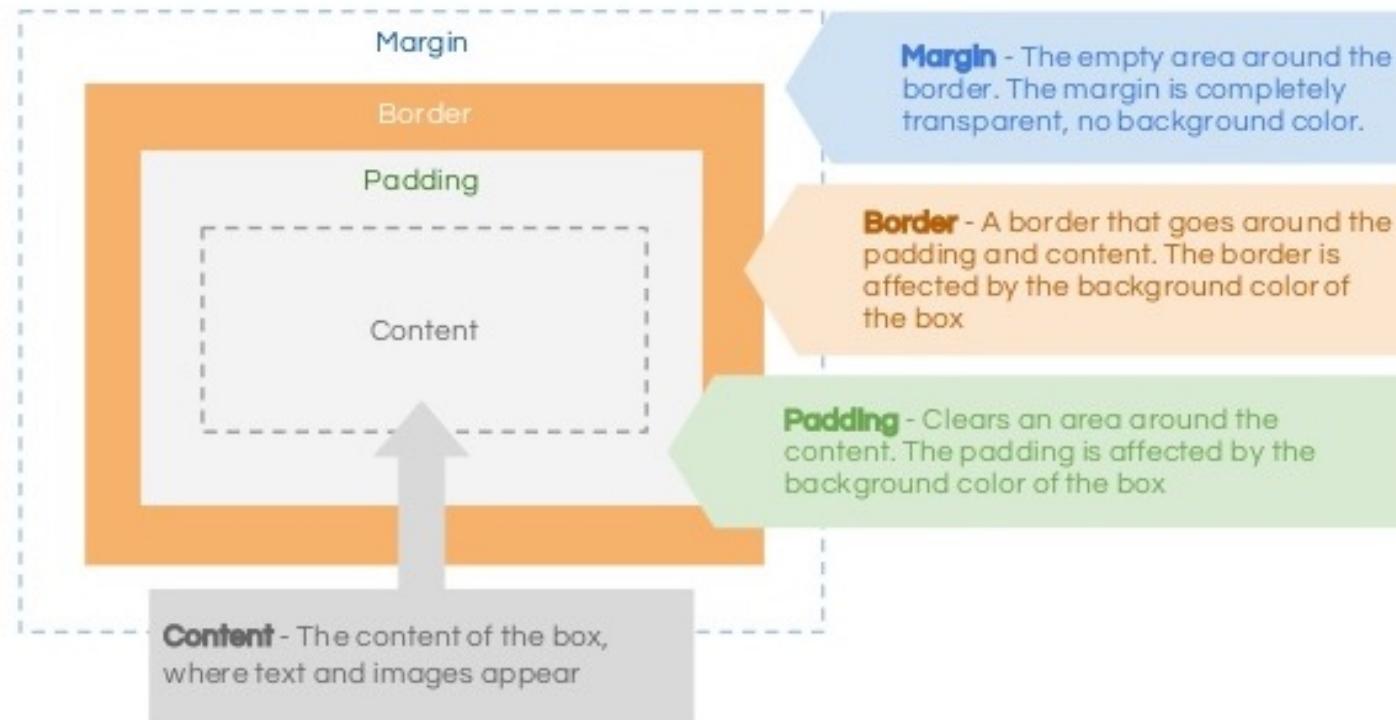

Cascading Style Sheets

# **CSS BOX MODEL**

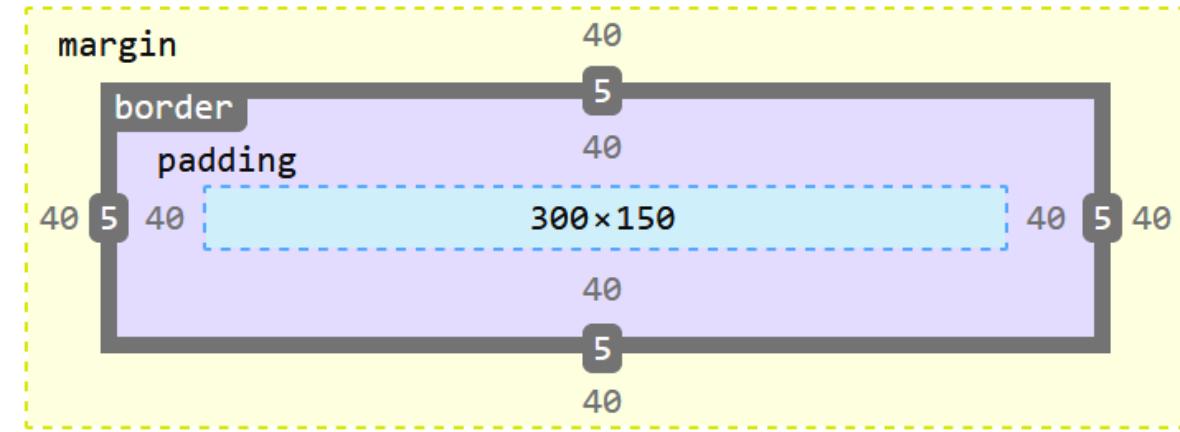

# The box model

- One of the cornerstones of CSS
- Every element on the page is considered to be a rectangular box

# The box model

- Total element width =  
width + left padding + right padding +  
left border + right border + left margin  
+ right margin
- Total element height =  
height + top padding +  
bottom padding + top border +  
bottom border + top margin + bottom  
margin
- You can set any of these  
properties, independently

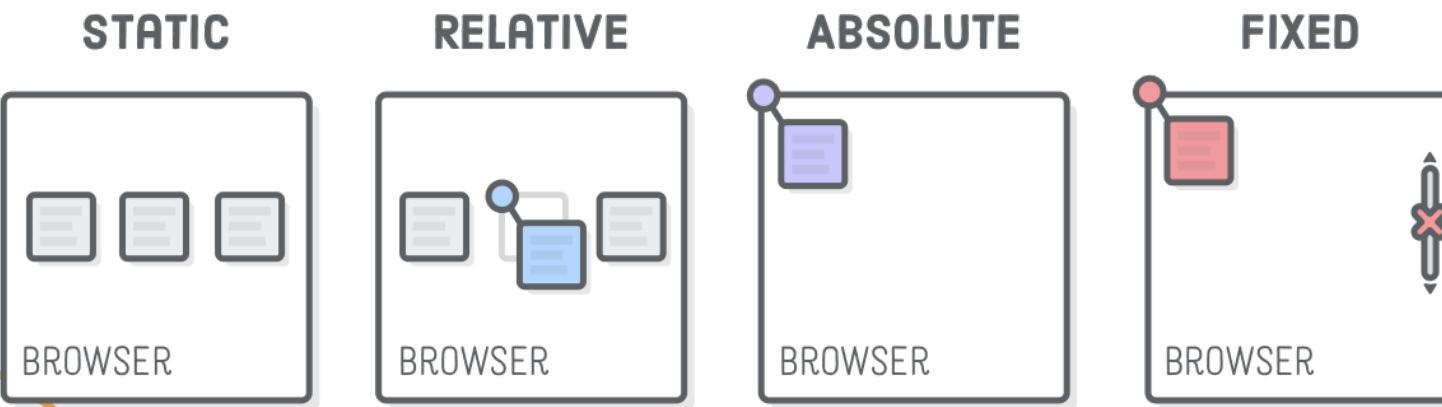

Cascading Style Sheets

# **CSS POSITIONING SCHEMES**

# Positioning schemes

- **Static:** normal flow (default)
- **Relative:** offset relative to the block position in the normal flow
- **Absolute:** the box position is determined by the top, left, right, bottom properties, relative to the containing block
- **Fixed:** fixed with respect to some reference point (the viewport)

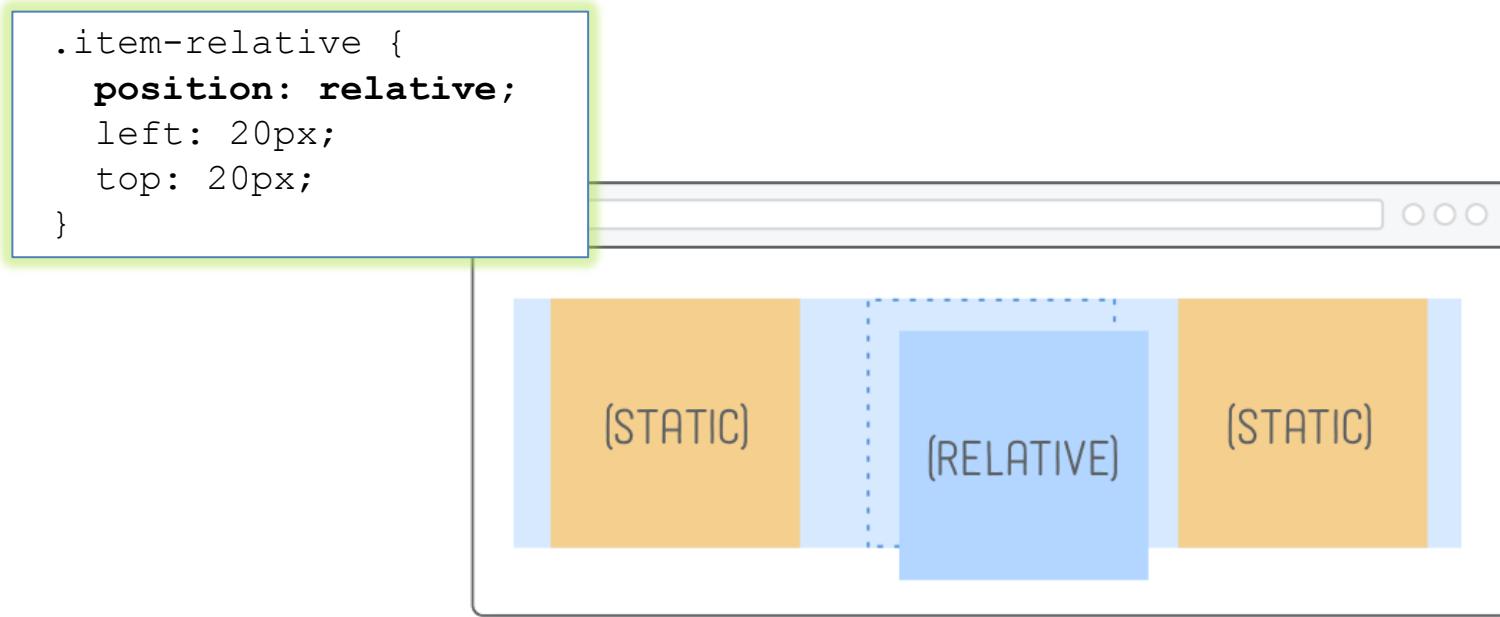

<https://internetingishard.com/html-and-css/advanced-positioning/>

```
.item {  
  position: static | relative  
  | absolute | fixed;  
  left: 20px;  
  top: 20px;  
}
```

# Relative positioning

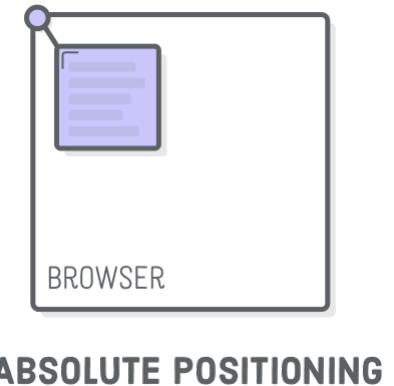

- One element can be shifted “relative” to its normal flow position by setting a vertical and/or horizontal offset

RELATIVE POSITIONING

# Absolute positioning

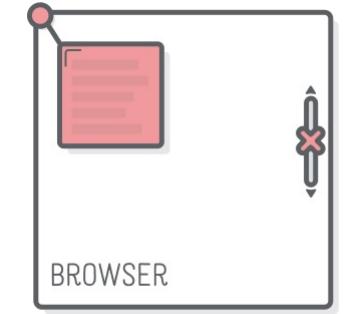

- Takes the element out of the flow of the document, thus taking up no space
- Other elements in the normal flow of the document will act as though the absolutely positioned element was never there

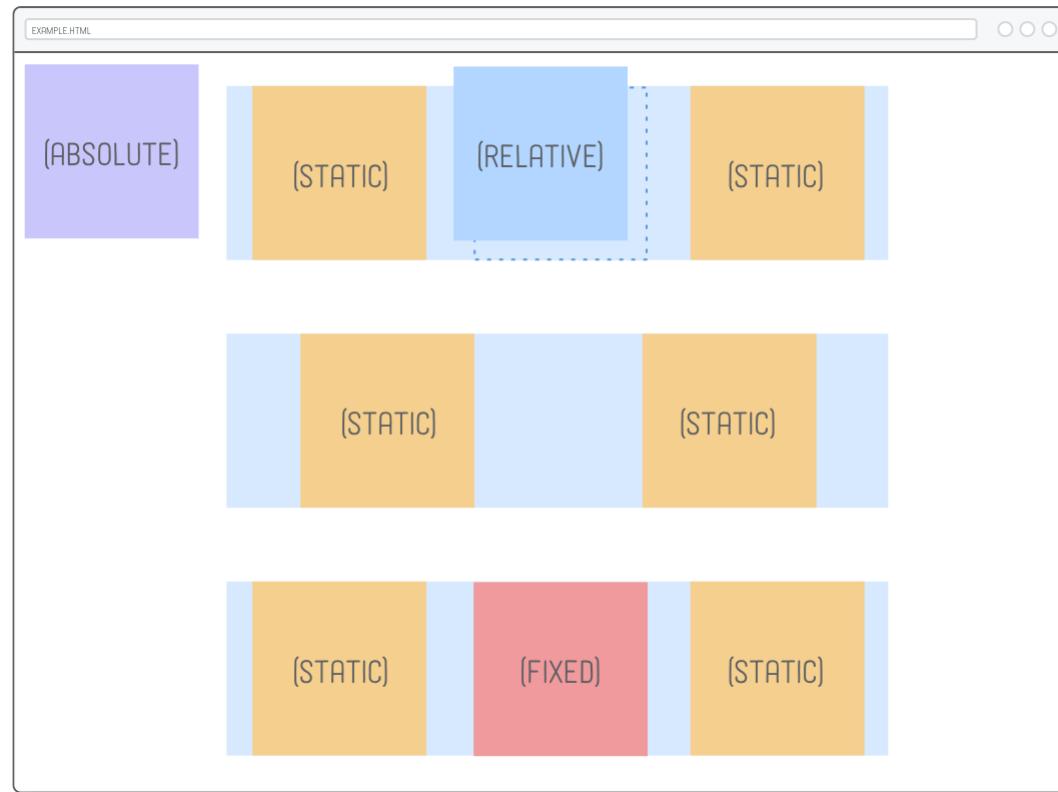

```
.item-absolute {  
  position: absolute;  
  left: 30px;  
  top: 350px;  
}
```

# Fixed positioning

- Has a lot in common with absolute positioning: the element is removed from the normal flow of the page, and the coordinate system is relative to the entire browser window
- The key difference is that fixed elements don't scroll with the rest of the page

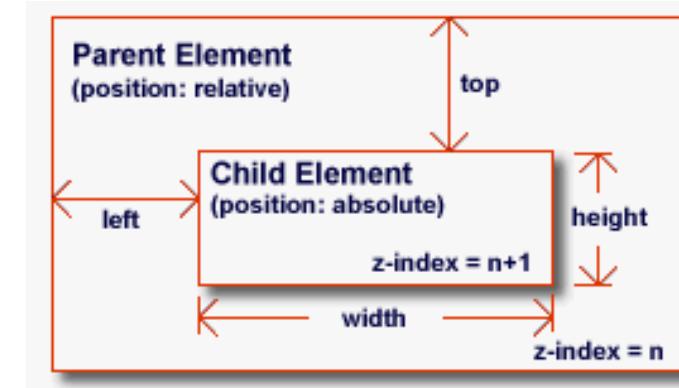

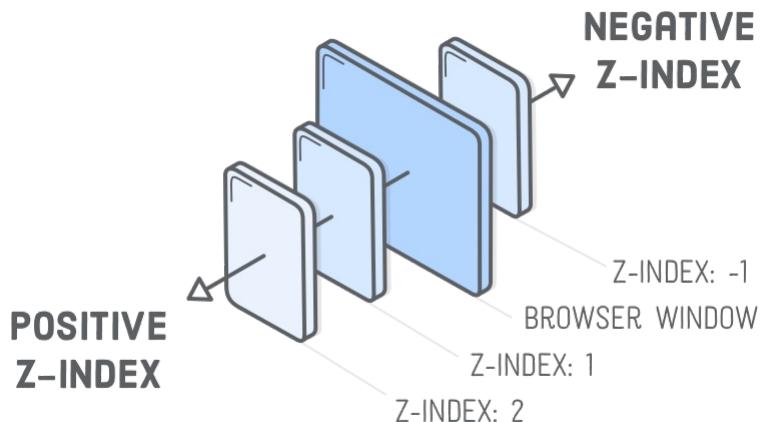

FIXED POSITIONING

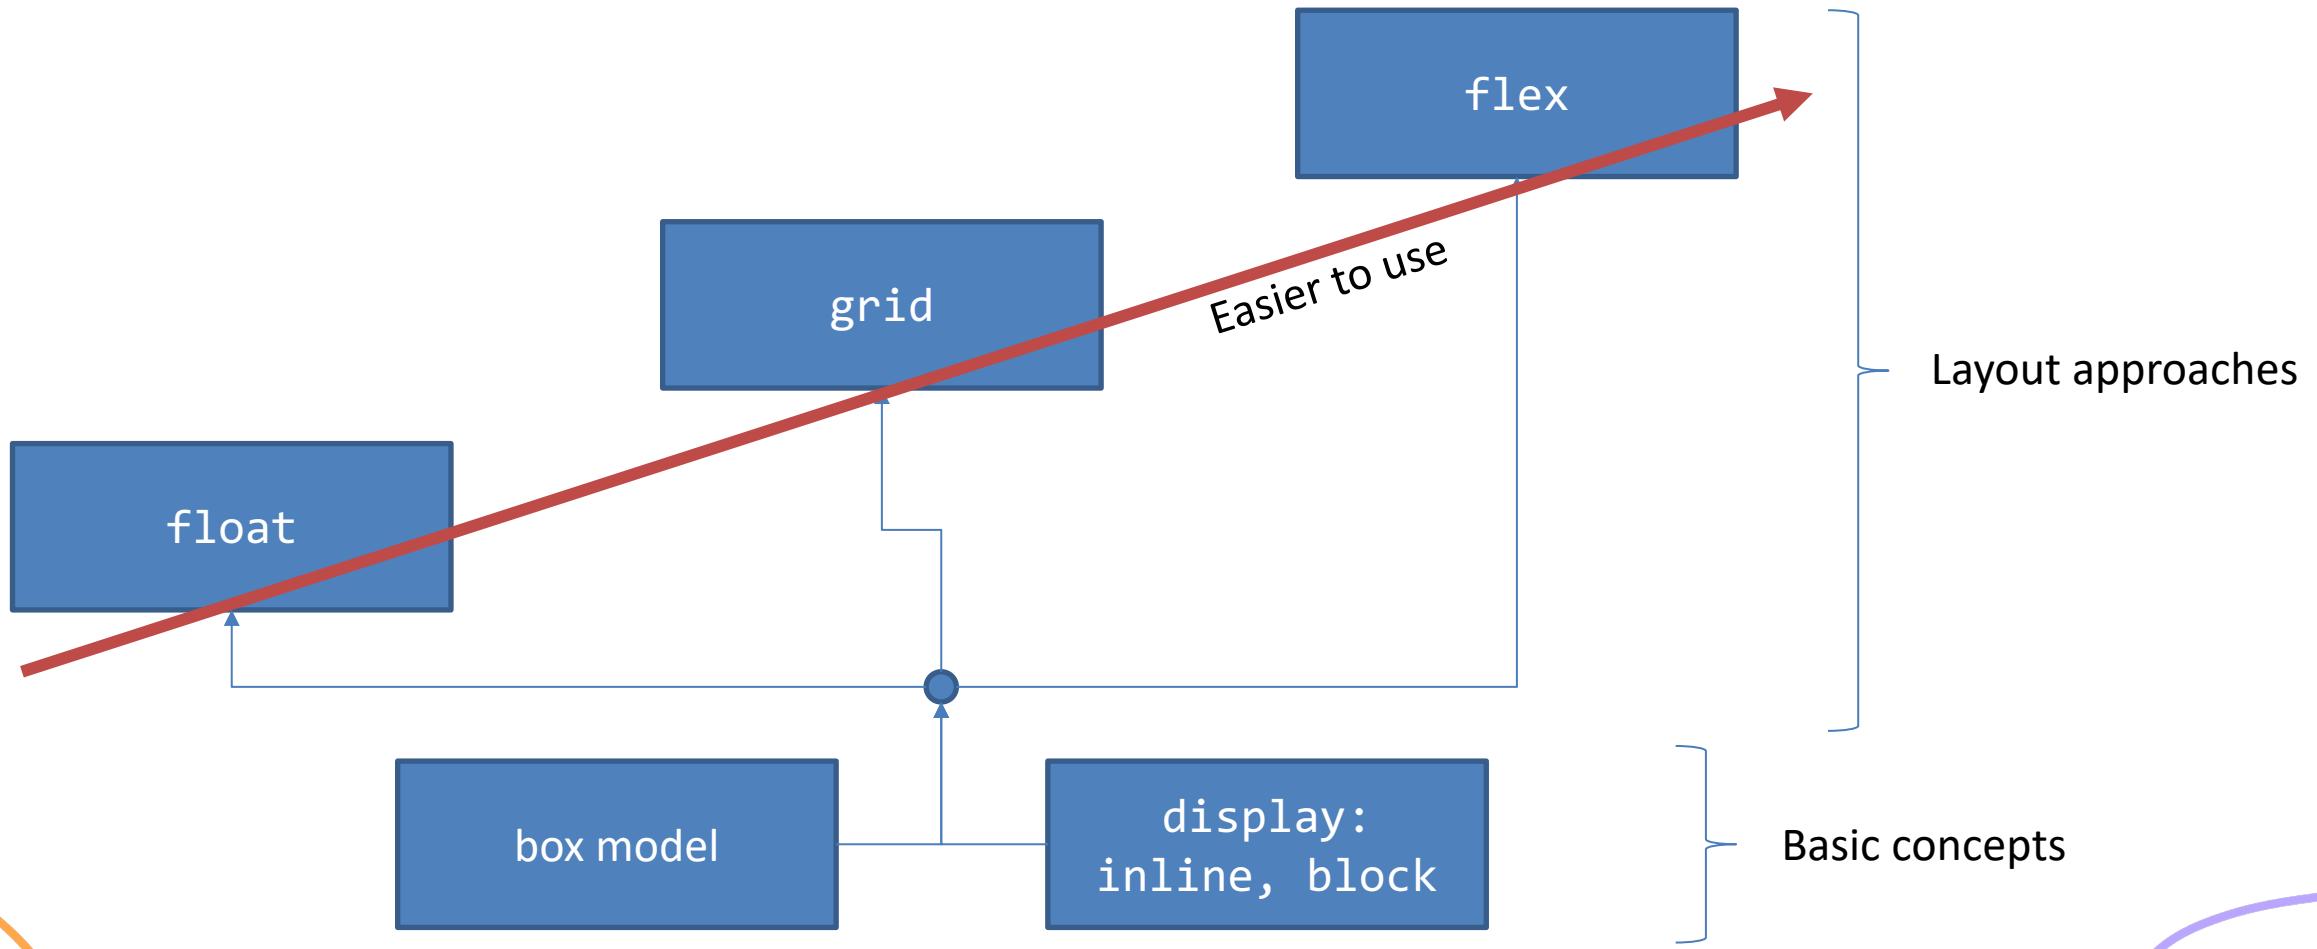

# z-index

- In case of overlaps the z-index property specifies the stack order of an element (which element should be placed in front of, or behind, the others)

# Page Layout Methods

Page Layouts

# FLOAT

# Floating

- The CSS **float** property gives control over the horizontal position of an element

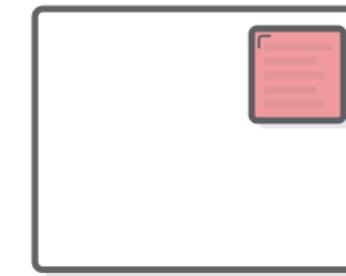

**LEFT ALIGN**

FLOAT: LEFT;

**CENTER ALIGN**

MARGIN: 0 AUTO;

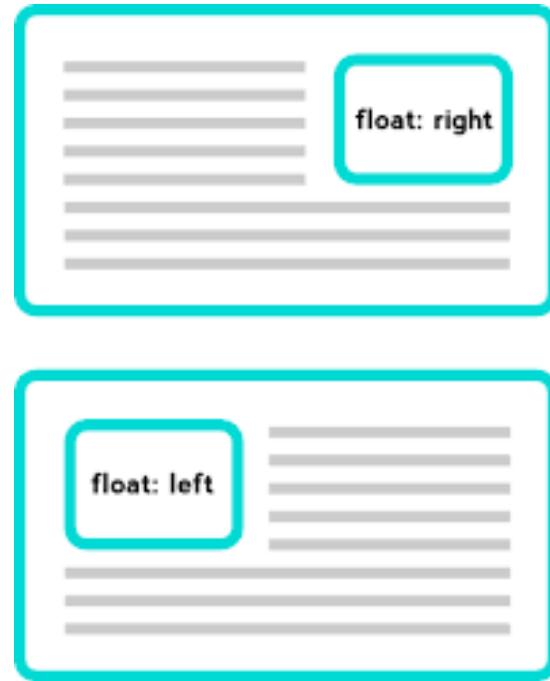

**RIGHT ALIGN**

FLOAT: RIGHT;

# Floating

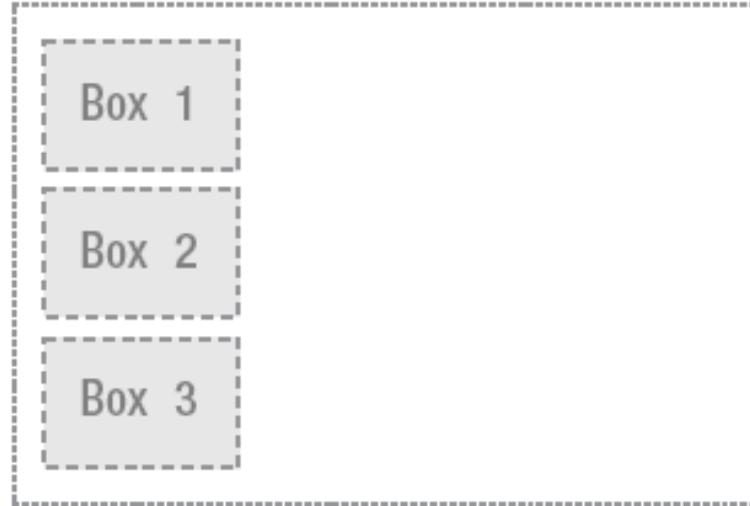

- A floated box can either be shifted to the left or the right until its outer edge touches the edge of its containing box, or another floated box
- Often used for images and when working with layouts

```
img  
{  
    float:right;  
}
```

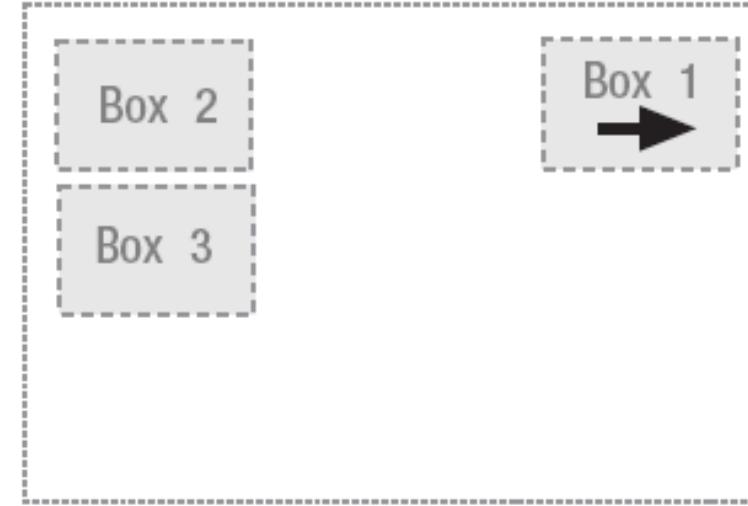

# Floating

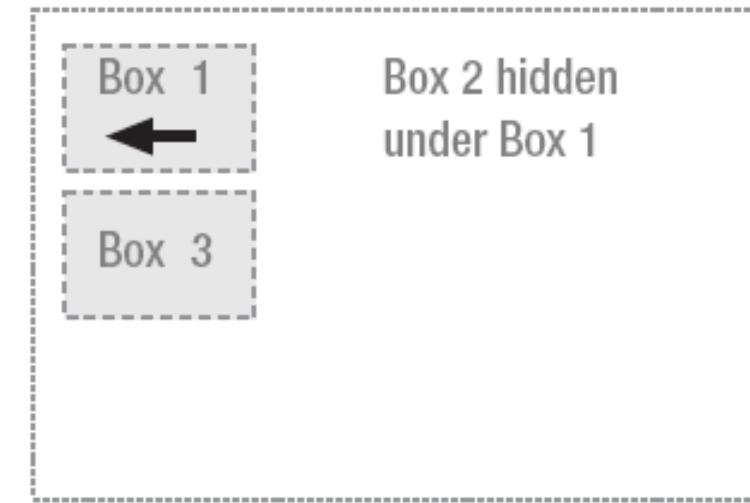

No boxes floated

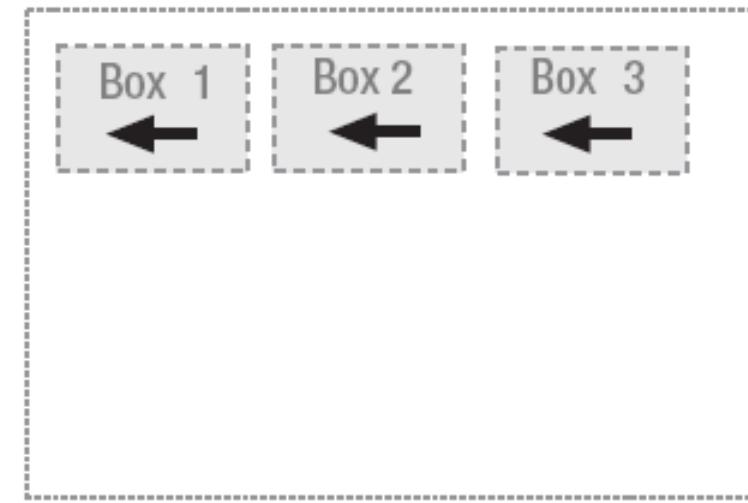

Box 1 floated right

Box 1 floated left

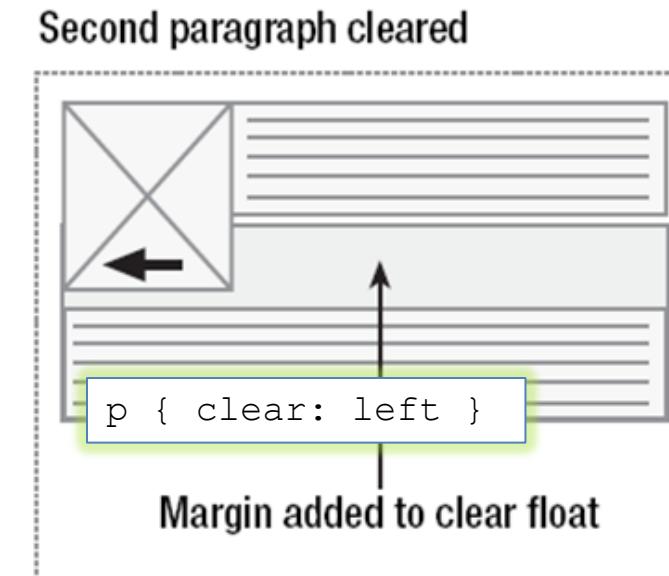

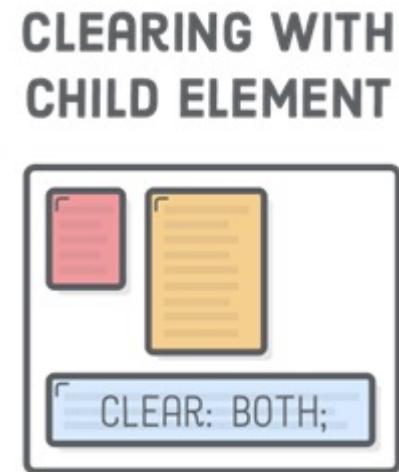

All three boxes floated left

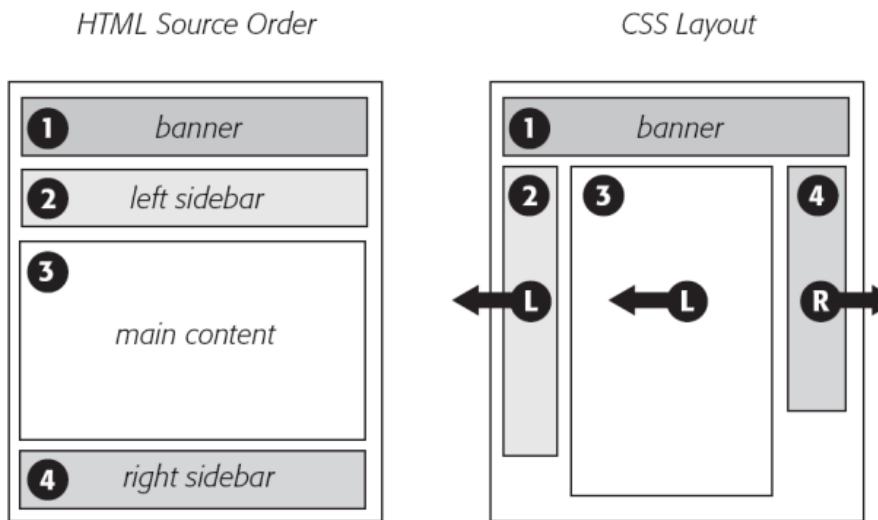

# Clearing Floats

- “Clearing” a float: tell a block to ignore any floats that appear before it
  - Instead of flowing around, a cleared element appears after any floats
  - It is like forcing a box back into the default vertical flow of the page

# Float-based Layouts

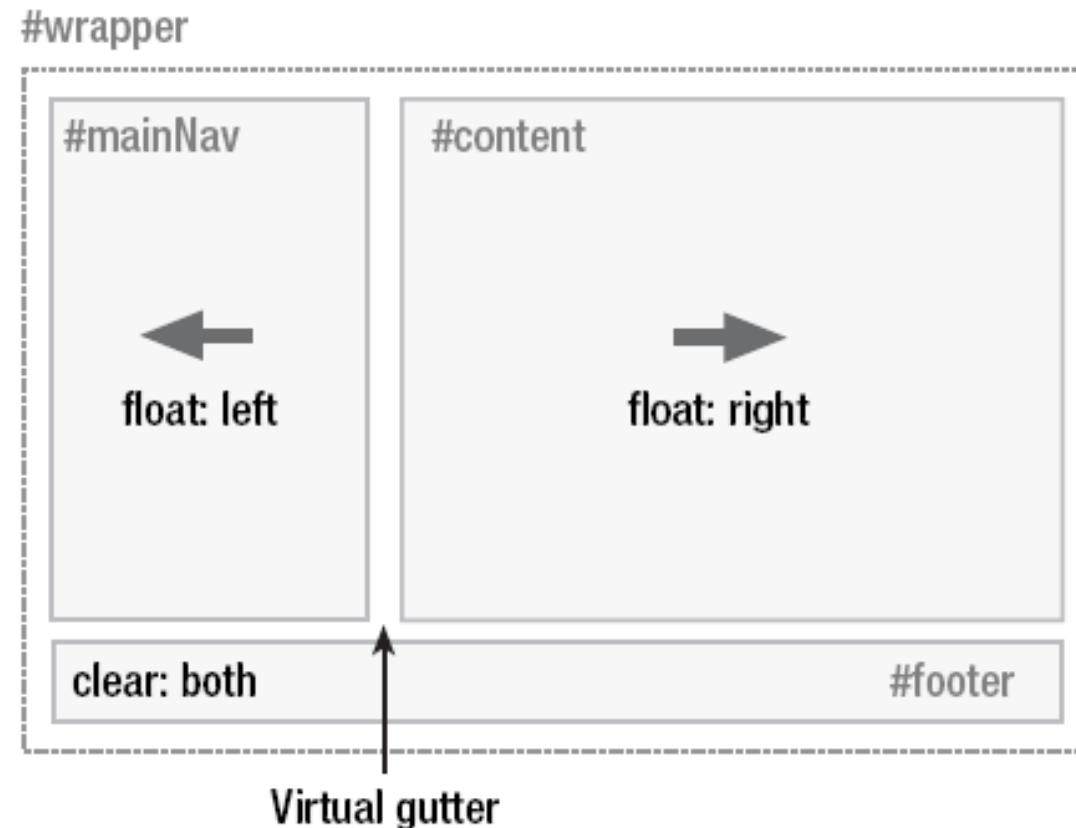

- Set the width of the elements you want to position, and then float them left or right
  - Two-column floated layout
  - Three-column floated layout

# Two-column Floated Layout

Create a virtual gutter by floating one element left and one element right

```
<div id="wrapper">  
  <div id="branding">  
    ...  
  </div>  
  <div id="content">  
    ...  
  </div>  
  <div id="mainNav">  
    ...  
  </div>  
  <div id="footer">  
    ...  
  </div>  
</div>
```

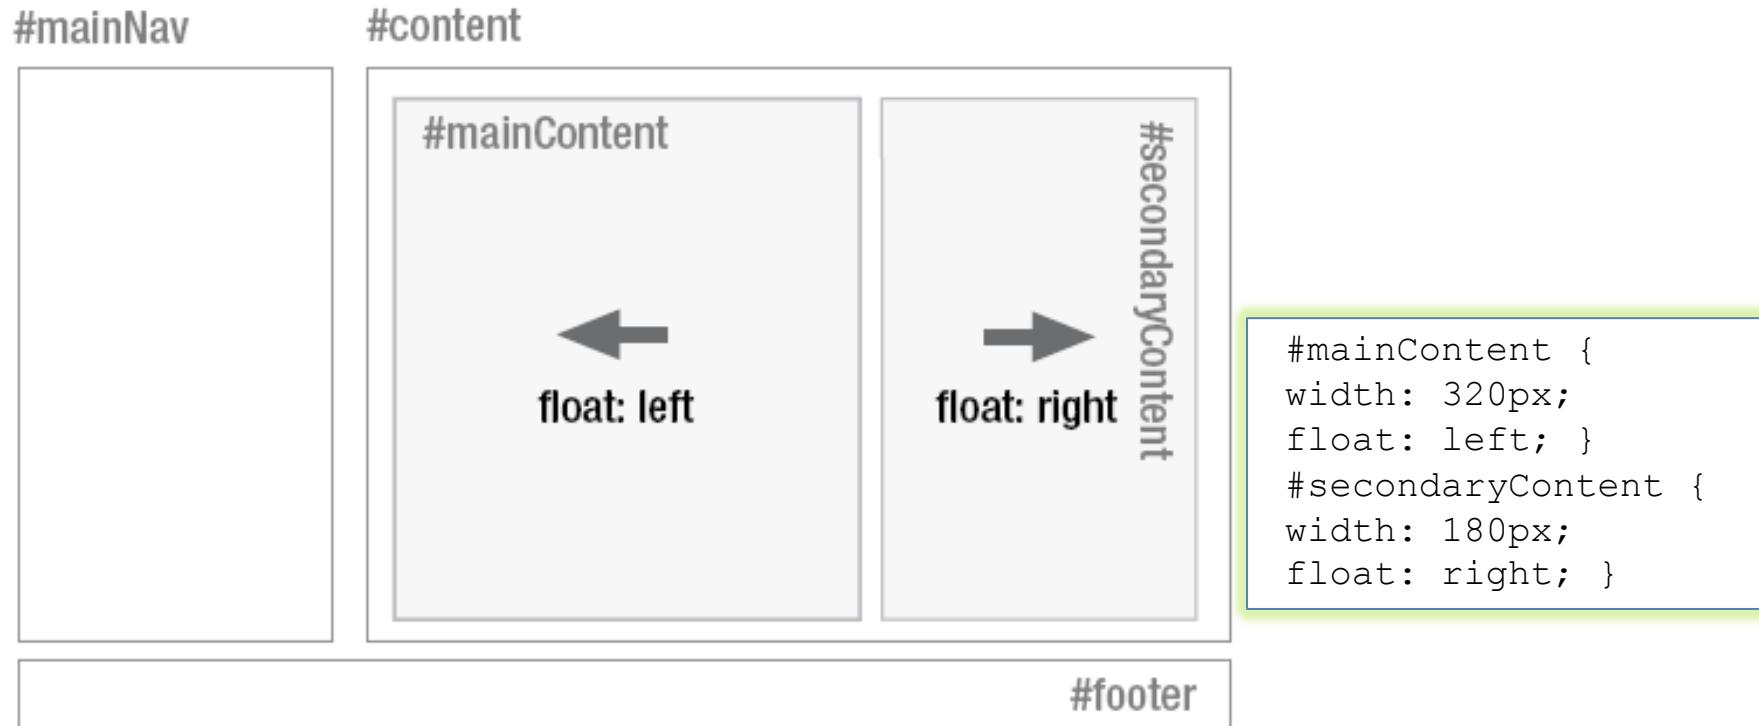

# Two-column Floated Layout

```
#content {  
width: 520px;  
float: right;  
}  
#mainNav {  
width: 180px;  
float: left;  
}  
#footer {  
clear: both;  
}
```

```
#mainNav {  
padding-top: 20px;  
padding-bottom: 20px;  
}  
#mainNav li {  
padding-left: 20px;  
padding-right: 20px;  
}  
#content h1, #content h2, #content p {  
padding-right: 20px;  
}
```
